Vellore Institute of Technology

(Deemed to be University under section 3 of UGC Act, 1956)

SCHOOL OF ELECTRICAL ENGINEERING

M. Tech Control and Automation

(M.Tech CA)

Curriculum

(*2024-2025 admitted students*)

VISION STATEMENT OF VELLORE INSTITUTE OF TECHNOLOGY

Transforming life through excellence in education and research.

MISSION STATEMENT OF VELLORE INSTITUTE OF TECHNOLOGY

World class Education: Excellence in education, grounded in ethics and critical thinking, for improvement of life.
Cutting edge Research: An innovation ecosystem to extend knowledge and solve critical problems.
Impactful People: Happy, accountable, caring and effective workforce and students.
Rewarding Co-creations: Active collaboration with national & international industries & universities for productivity and economic development.
Service to Society: Service to the region and world through knowledge and compassion.

VISION STATEMENT OF THE SCHOOL OF ELECTRICAL ENGINEERING

To offer an education in electrical engineering that provides strong fundamental knowledge, skills for employability, cross-disciplinary research and creates leaders who provide technological solutions to societal and industry problems.

MISSION STATEMENT OF THE SCHOOL OF ELECTRICAL ENGINEERING

- Provide personalized experiential learning in industry sponsored laboratories to prepare students in electrical engineering with strong critical thinking and employability skills.
- Foster design thinking, creativity and cross-disciplinary research with highly qualified faculty to create innovators and entrepreneurs in the broad area of electrical engineering.
- Collaborate with national and international partners to provide innovative solutions to societal and industry challenges.

VIT
Vellore Institute of Technology
(Deemed to be University under section 3 of UGC Act, 1956)

M. Tech Control and Automation

PROGRAMME EDUCATIONAL OBJECTIVES (PEOs)

1. Graduates will be engineering practitioners and leaders, who would help solve industry's technological problems.

2. Graduates will be engineering professionals, innovators or entrepreneurs engaged in technology development, technology deployment, or engineering system implementation in industry.

3. Graduates will function in their profession with social awareness and responsibility.

4. Graduates will interact with their peers in other disciplines in industry and society and contribute to the economic growth of the country.

5. Graduates will be successful in pursuing higher studies in engineering or management.

6. Graduates will pursue career paths in teaching or research.

M. Tech Control and Automation

PROGRAMME OUTCOMES (POs)

PO_01: Having an ability to apply mathematics and science in engineering applications

PO_02: Having an ability to design a component or a product applying all the relevant standards and with realistic constraints

PO_03: Having an ability to design and conduct experiments, as well as to analyze and interpret data

PO_04: Having an ability to use techniques, skills and modern engineering tools necessary for engineering practice

PO_05: Having problem solving ability- solving social issues and engineering problems

PO_06: Having adaptive thinking and adaptability

PO_07: Having a clear understanding of professional and ethical responsibility

PO_08: Having a good cognitive load management [discriminate and filter the available data] skills

VIT
Vellore Institute of Technology
(Deemed to be University under section 3 of UGC Act, 1956)

M. Tech Control and Automation

ADDITIONAL PROGRAMME OUTCOMES (APOs)

APO_01: Having an ability to be socially intelligent with good SIQ (Social Intelligence Quotient) and EQ (Emotional Quotient)

APO_02: Having Sense-Making Skills of creating unique insights in what is being seen or observed (Higher level thinking skills which cannot be codified)

APO_03: Having design thinking capability

APO_04: Having computational thinking (Ability to translate vast data in to abstract concepts and to understand database reasoning

APO_05: Having Virtual Collaborating ability

APO_06: Having an ability to use the social media effectively for productive use

APO_07: Having critical thinking and innovative skills

APO_08: Having a good digital footprint

M. Tech Control and Automation

PROGRAMME SPECIFIC OUTCOMES (PSOs)

On completion of M. Tech. (Control and Automation) programme, graduates will be able to

- PSO1: Apply technical knowledge, skills and analytical ability to design and develop controllers as well as employ techniques for automation of systems using modern tools and technologies.

- PSO2: Analyse, interpret and solve problems related to process control, automation, measurement and control etc.

- PSO3: Solve research gaps and provide solutions to socio-economic, and environmental problems.

Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

To present a clear exposition of basics of linear algebra, matrix theory, differential equations to represent the nonlinear systems through mathematical methods including,

1. Understanding of their physical significance and mathematical representation of nonlinear systems through modelling.
2. Existence and uniqueness of the solution of the models, computation of equilibrium points and visualize their behaviour through phase plane analysis.
3. Stability analysis and controller design for nonlinear systems.

Course Outcome:

On completion of the course, the student will be able to

1. Analyse and interpret the physical significance of different mathematical tools such as vector space, convergence, continuity, eigen values, eigen vectors and matrix norm to represent the dynamical systems and their applications to control theory as well as visualize the behaviour of the dynamical system in different coordinate dimensional coordinates.
2. Represent the dynamical systems in the form of differential equation and check the existence of the solution of the differential equation and learn different methods for solving it.
3. Analyse the behaviour and properties of nonlinear systems such as equilibrium points, limit cycles through phase plane technique.
4. Utilize different mathematical tools such as convergence, continuity and differentiability to analyse the stability criteria of the nonlinear systems, describing function method to analyse stability in frequency domain.
5. Utilize different design techniques such as feedback linearization, back stepping method and feedback control to design controller for nonlinear dynamical systems.

Module:1	Basics of Linear Algebra:	7 hours

Introduction to set theory, vector fields, Physical Interpretation of Linear Vector Spaces, Supremum and infimum, Physical Interpretation of Normed Linear Spaces, Banach and Hilbert Spaces, Physical Interpretation of Convergence, Continuity, Differentiability and Applications

Module:2	Matrix Theory:	8 hours

Physical Interpretation of Eigenvalues and Eigenvectors and its applications, Matrix Transformations, Physical Interpretation of Induced Norms and Matrix Measures, Similarity Transformation-Diagonalization, Singular values, Singular Value Decomposition (SVD) and its Applications, Pseudo Inverse, Jacobian matrix, Linear matrix inequalities, concept of rank, and nullity

Module:3	Differential Equations:	6 hours

Existence, Physical Interpretation of Uniqueness, Physical Interpretation of Well-posedness of Solutions, Approximation of Solutions, Lipchitz condition, Comparison functions and their applications

Module:4	Analysis of Dynamical Systems:	8 hours

Introduction, Features of Linear and Nonlinear Systems: Examples of phenomena, models &

derivation of system equations. Fundamental properties: Existence & uniqueness, Dependence on initial conditions & parameters, Equilibrium points, Taylor's series, Types of non-linearity, Common nonlinearities in control systems, Typical Examples		
Module:5	**Phase Plane Analysis:**	**8 hours**
Concepts of phase plane analysis, Construction of phase portrait, Phase plane analysis of linear system and nonlinear system, Existence of limit cycles		
Module:6	**Stability Analysis:**	**10 hours**
Lyapunov stability of autonomous and nonautonomous systems, LaSalle's invariance Principle, Stability analysis of nonlinear systems in frequency domain: Describing function fundamentals, describing functions of common nonlinearities, Describing function analysis of nonlinear systems, Limit cycles, Stability of Oscillations		
Module:7	**Case Studies: Controller Design Problems and Solutions**	**10 hours**
Feedback linearization method, Backstepping method, Feedback control technique, Introduction to Linear programming.		
Module:8	**Contemporary Issues**	**3 hours**
	Total Lecture hours:	**60 hours**

Textbook(s)	
1.	Alexander S. Poznyak, "Advanced Mathematical Tools for Automatic Control Engineers", Elsevier, First Edition, 2008
2.	Slotine and Li, "Applied Nonlinear Control", Prentice Hall Inc., 2005.
Reference Books

3.	D. Smith, M. Eggen and R. St. Andre, "A Transition to Advanced Mathematics" Cengage Learning International Edition, 2014.
4.	K A. Ross "Elementary Analysis" Springer, 2013.
5.	H. Logemann and E. P. Ryan "Ordinary Differential Equations", Analysis, Qualitative Theory and Control, Springer, 2014.
Mode of Evaluation**:** CAT / Assignment / Quiz / FAT / Project / Seminar	

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA502L	System Theory	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

To present a clear exposition of the basics of modern control including

1. Create state models of practical systems after understanding state modelling concepts
2. Analyse the models for the five properties of stability, controllability, observability, stabilizability and detectability
3. Design a controller, observer and reduced-order observer for the models of the systems

Course Outcome:

On completion of the course, the student will be able to

1. Model dynamical systems and realize them in different canonical forms
2. Solve the linear and nonlinear state equations
3. Analyze the state models for the five properties of the systems
4. Design a state feedback controller and state observer for simple practical dynamic systems.
5. Analyze linear and nonlinear system models for stability

Module:1	State Variable Representation:	6 hours

Introduction-Concept of State-State equation for Dynamic Systems-Time invariance and linearity-Non uniqueness of state model-canonical forms - State Diagrams-Physical System and State Assignment

Module:2	Solution of State Equation:	6 hours

Existence and uniqueness of solutions to continuous-time state equations-Solution of linear time varying and linear time invariant state equations-Evaluation of matrix exponential-System modes-Role of Eigenvalues and Eigenvectors.

Module:3	Properties of the System:	6 hours

Stability, Controllability and Observability - Stabilizability and Detectability-Test for Continuous time systems- Time varying and Time invariant case.

Module:4	Controller and Observer Design:	6 hours

Introduction-Controllable and Observable Companion Forms-SISO and MIMO Systems- The Effect of State Feedback on Controllability and Observability-Pole Placement by State Feedback for both SISO and MIMO Systems-Full Order and Reduced Order Observers.

Module:5	Lyapunov Stability:	6 hours

Introduction-Equilibrium Points-Stability in the sense of Lyapunov-BIBO Stability-Stability of LTI Systems-Equilibrium Stability of Nonlinear Continuous Time Autonomous Systems.

Module:6	Lyapunov's Direct Method:	6 hours

The Direct Method of Lyapunov and the Linear Continuous-Time Autonomous Systems-Finding Lyapunov Functions for Nonlinear Continuous Time Autonomous Systems-Krasovskii and Variable-Gradient Method.

Module:7	Realization:	6 hours

Output Controllability-Reducibility- System Realizations minimal realization, balanced realization

Module:8	**Contemporary Issues**	**3 hours**
	Total Lecture hours:	**45 hours**

Textbook(s)	
1.	Ogata, "Modern Control Engineering", 5th Edition, Prentice Hall India, 2010.
2.	M. Gopal, “Modern Control System Theory”, 3rd edition, New Age International, 2014.
Reference Books	
1.	Slotine and Li, "Applied Nonlinear Control", Prentice Hall Inc., 2005.
2.	Hassan K Khalil, “Nonlinear Control", Pearson, Boston, 2015.

Mode of Evaluation**:** CAT / Assignment / Quiz / FAT / Project / Seminar

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA502P	System Theory Lab	0	0	2	1
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Analyse the behaviour of linear and nonlinear dynamic systems
2. Design controller, observer and reduced-order observer

Course Outcomes

On completion of this course, the student will be able to:

1. Analyse the response and properties of linear and nonlinear dynamic systems
2. Design controller, observer, and reduced-order observer for linear systems

List of Challenging Experiments (Indicative)		
1.	State modelling of armature-controlled motor	2 hours
2.	State modelling of field-controlled motor	2 hours
3.	State modelling of dc generator	2 hours
4.	State modelling of balancing broomstick	2 hours
5.	State modelling of bridge circuit	2 hours
6.	State modelling of magnetic suspension system	2 hours
7.	State modelling of ball on beam system	2 hours
8.	Controllability and observability of armature-controlled dc motor	2 hours
9.	Controllability and observability of balancing broomstick	2 hours
10.	Controllability and observability of bridge circuits	2 hours
11.	Controllability and observability of magnetic suspension system	2 hours
12.	Design of state feedback controller for balancing broomstick problem	2 hours
13.	Design of observer for balancing broomstick problem	2 hours
14.	Design of state feedback controlled balancing broomstick problem with observer	2 hours
15.	Stability analysis of straight and inverted pendulum	2 hours
	Total Laboratory Hours	**30 hours**

Mode of assessment: Continuous assessment, FAT

Course Code	Course Title	L	T	P	C
MCOA503L	Random Variables and State Estimation	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Impart knowledge on random processes and the estimation process
2. Explore prediction and identification methods to recognize and control random processes
3. Estimate a system model using parametric and non-parametric approaches

Course Outcome

On the completion of this course the student will be able to:

1. Characterize the random variables based on single and multiples random variables functions
2. Analyze the behavior of a random process using statistical tools
3. Design optimal estimators for variables and systems having stochastic nature
4. Apply the concepts of filtering and prediction for a random process
5. Conduct experiments to build and test parametric and non-parametric system models

Module:1	Random Variables	Hours: 6

Probability**:** Sample space, Conditional probability, Bayes theorem; Random variable: Cumulative Distribution Function (CDF), Probability Density Function (PDF), Conditional CDF; Multiple random variable: Joint Cumulative Distribution Function, Joint Probability Density Function; Computation of Expected Values

Module:2	Random Process and their characteristics	Hours: 7

Random Process Characterization: Densities & Joint densities, Mean, Variance, Expectation of a Random Process; Classification of Random Processes: SSS, WSS, Ergodic, joint stationary; Correlation functions: Autocorrelation, autocovariance, cross-correlation, cross-covariance function; Temporal and Spatial Characteristics; White Noise

Module:3	Parameter Estimation	Hours: 8

Bayes Performance Measure, Statistical Characterizations of Data; Cramer-Rao bounds; Bayes Estimation: Maximum a posteriori (MAP) estimation, Minimum Mean Square Error (MMSE) Estimate: Linear MMSE Estimation, Nonlinear MMSE Estimation; Estimation of Nonrandom Parameters: Maximum Likelihood Estimation

Module:4	Wiener Estimation	Hours: 6

Optimum Filter Formulation: Prediction of a Random Process, Filtering out Noise, Interpolation for Random Processes; Wiener Hoff Equation; Wiener filter design: FIR Wiener filter, Linear Time-Invariant Noncausal Filter (IIR), Linear Time-Invariant Causal Filter (IIR); Application of Weiner's theory in feedback control system

Module:5	Kalman Estimation	Hours: 6

State Dynamics with Random Excitations, Markov Sequence Model, Observation Model; Kalman Filter estimator: Anatomy and Physiology of the Kalman Filter; Prediction: Fixed lead prediction, sliding window; Steady state equivalence of the Kalman and Wiener filter: Kalman filter formulation, Wiener filter formulation

Module:6	Nonparametric Model Estimation	Hours: 5

Correlation and spectral analysis for non-parametric model identification, obtaining estimates of the plant impulse, step and frequency responses from identification data.

Module:7	Parametric Model Estimation	Hours: 5

Prediction Error Model Structures, parametric estimation using one-step ahead prediction error model structures and estimation techniques for ARX, ARMAX, Box-Jenkins, FIR, Output Error models. Nonlinear model estimation: NAR, NARX, NARMA, NARMAX models

Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Mode of Evaluation **:** Continuous Assessment Tests, Quizzes, Assignment, Final Assessment Test			
Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA504L	Smart Sensor Systems	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. To impart knowledge on Smart sensing technology and its applications.
2. To introduce the standards and protocols used for smart sensing.

Course Outcome:

On the completion of this course the student will be able to:

1. Select the right sensor for a given application.
2. Design basic building blocks for a Smart sensor.
3. Design compensators and perform calibration for smart sensors.
4. Design, synthesize and layout a VLSI sensor and design micro power generation systems
5. Interpret the standards and protocols used for the smart sensor design and apply smart sensors for Health, Industrial and Home related applications.

Module:1	Smart Sensor Introduction:	6 hours

Classic vs Smart sensors, Architecture of Smart Sensors: Important components, their features. Monolithic integrated smart sensor, Hybrid integrated smart sensor, Micro Sensors; Impedance sensing system, Smart temperature sensor, Smart Wind sensor, Smart Hall sensor.

Module:2	Linearization:	7 hours

Linearization using shunt resistance, Divider circuit, higher order linearizing circuit. Linear interpolation, Piecewise linearization, Lookup table approach, Adaptive filters based approach.

Module:3	Calibration and Compensation:	6 hours

Calibration and Self Calibration of smart sensors, Offset compensation, Error and Drift compensation, Lead wire compensation, Temperature effect and compensation. Uncertainties

Module:4	VLSI Sensors:	6 hours

Analog Numerical computation - CORDIC Computation. Adaptive filtering – LMS algorithm, Bit stream multiplication. Analog VLSI based Neural Network.

Module:5	Micro-power Generation:	6 hours

Introduction, Energy storage system, Thermoelectric energy harvesting, Vibration and Motion energy harvesting, Far-Field RF energy harvesting, Photovoltaic.

Module:6	Standards and protocols:	7 hours

Introduction, IEEE 1451 Standard, Network technologies, LonTalk, CEBUS Communication protocol for smart home, J1850 Bus, Plug-n-Play Smart Sensor Protocol.

Module:7	Case Studies:	5 hours

Design and Implementation of IoT for Environmental Condition Monitoring, Development of Smart Bed for Health Care Application, Study of Smart City and its Design, Wearable smart sensors, Biosensors and applications.

Module:8	Contemporary Issues	2 hours

	Total Lecture hours:	**45 hours**

Mode of Evaluation: CAT / Assignment / Quiz / FAT / Project / Seminar			
Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA505L	Process Dynamics and control	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. Introduce the modelling of various physical processes using first principle
2. Understand various control modes and tuning of controller.
3. Study advanced control strategies based on process model.

Course Outcome:

On the completion of this course the student will be able to:

1. Develop mathematical models for dynamic processes
2. Select and tune PID controllers for the given systems.
3. Choose necessary final control element for a given application.
4. Design a control strategy for a process involving multiple variables and constraints.
5. Design and Conduct experiments, as well as analyse and interpret data

Module:1	Process Dynamics:	7 hours

Need for Process Control; objective of modelling: models of level, thermal and flow processes; Integrating and non-integrating systems; Degrees of Freedom; Continuous and batch processes; Self-regulation; Lumped and Distributed parameter models; Linearization of nonlinear systems; P&ID diagram

Module:2	Dynamic and Steady State Behaviour of Process:	4 hours

Dynamic response of a first order process; First order plus dead time process; Second order process; Pure capacitive process; Pure dead time; Higher order process; Inverse response; Pade approximation.

Module:3	Control Actions:	7 hours

Concept of servo and regulatory problems; Selection of measured, manipulated and controlled variables; Types of controller; Characteristic of on-off controller; proportional, integral and derivative controllers; P+I,P+D and P+I+D control modes; anti-reset windup; bumpless transfer; practical forms of PID control; selection of control modes for different processes.

Module:4	Design of feedback controller:	6 hours

Evaluation criteria: IAE, ISE, ITAE and ¼ decay ratio; Tuning methods: Process reaction curve method; Continuous cycling method; Direct synthesis

Module:5	Final Control Elements:	6 hours

I/P converter; Pneumatic and electric actuators; Valve Positioner; Control Valves; Characteristic of Control Valves: Inherent and Installed characteristics; Valve body; Commercial valve bodies; Control valve sizing; Cavitation and flashing; Selection criteria.

Module:6	Enhancement to single loop regulatory control:	7 hours

Feed forward controller: design with steady state model, design with dynamic model; combination of feed forward-feedback structure; Cascade control: analysis and design; Ratio control; Split range control; Override control; Inferential control.

Module:7	Model based control:	6 hours

IMC structure – development and design - IMC based PID control – MPC: Dynamic matric control, Generalized predictive control; Multi-loop Control: Introduction; Process Interaction; Pairing of Inputs and Outputs; The Relative Gain Array (RGA).		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Course Code	Course Title	L	T	P	C
MCOA505P	Process Dynamics and Control Lab	0	0	2	1
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Gain adequate knowledge on the practical implementation of various control strategies for real-time processes
2. Design and Implementation of Cascade, Ration, Feed-forward and advanced Control schemes using the facilities available in the Process Control lab.

Course Outcomes

On completion of this course, the students will be able to:

1. Measure various process parameter and design suitable control schemes for industrial type process.
2. Design Feed Forward, Cascade and Multiloop PID controllers for the typical industrial process.

Indicative Experiments

1.	Identify the dynamics of first order, second order, interacting and non-interacting processes	
2	Experimental Study of PID controller on Level process station	
3.	Modelling and Control of Pressure Process station	
4.	Experimental Study of ON-OFF and PID controller on Temperature Process	
5.	Analysis of inherent and installed characteristics of control valves	
6.	Experimental Study of Cascade / Ratio Control for a Level-Flow Process	
7.	Performance comparison of PID controller tuning methods using MATLAB	
8.	Simulation of nonlinear processes using MATLAB	
9.	Performance comparison of single and multi-loop controllers	
10	Design and verification of Feed Forward controller	
11	Disturbance rejection assessment of IMC-PI controller	
12	Design and implementation of Velocity and Position form of PID Control algorithms using MATLAB	
13	Realization of PID controllers using LabVIEW	
14	Boiler drum level control using PID controller in LabVIEW	
	Total Laboratory Hours	**30 hours**

Mode of assessment: Continuous assessment, FAT

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA506L	Real Time Embedded systems	2	0	0	2
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. Identify modern embedded systems requirements and its' design constraints
2. Acquire hardware and software skills required for the role of embedded system engineer
3. Build automated control systems for real world problems using low cost embedded platforms

Course Outcomes:

On the completion of this course the student will be able to:

1. Identify a microcontroller based on application specifications.
2. Develop embedded software using commercial integrated development environments
3. Interface sensors and actuators using suitable communication protocols
4. Design data acquisition system for embedded measurement and control applications
5. Design and implement real-time embedded control applications

Module:1	Embedded systems	2 hours

Embedded system components; Examples of embedded system; Attributes; Characteristics; Challenges in embedded computing system design; Typical embedded system software operations

Module:2	ARM Cortex-M Architecture	3 hours

CPU core: Architecture, Registers, Operating modes; Memory organization; Instructions: Instruction formats, and addressing modes; Exceptions and Interrupts; Commercial ARM Cortex-M microcontrollers

Module:3	Programming Embedded Systems	3 hours

Embedded C programming: Number systems, Data types, Data structures, Functions, Bitwise operations; Improving responsiveness: Interrupts, Finite state machines; Concurrency; Scheduling; Context switching; Real-time systems; Embedded software development: Host and target, Compiler, Assembler, Linker, and Loader; Hardware and software debugging, In system programming

Module:4	Peripherals and Interfacing	5 hours

Memory mapped IO; GPIO programming: Push-Pull, Open-Drain modes, Pull up and Pull down modes, Input and output devices; Timing generation and measurements: Timers, and PWM, Input capture; ADC, DAC, Analog comparator; Block data transfer using DMA; Real Time Clock (RTC); Power management

Module:5	Serial Communication Protocols	5 hours

Serial communication protocols: UART, I2C, SPI, and CAN; Architecture; electrical considerations; message formats; message types; transmission and arbitration; Data visualization using logic analysers

Module:6	Data acquisition System Design	5 hours

Analog interfacing and data acquisition; Transducers; Current to voltage circuit, Instrumentation amplifier, isolation, Anti-aliasing filters; Nyquist theory to determine sampling rate; Measurement of voltage, current, and temperature; Analysis of noise; Techniques to reduce noise; Optical encoders for speed and position measurement; Data acquisition case studies

Module:7	Embedded Control System	5 hours

Closed loop control system: Set-point control and trajectory tracking; Design process for a PID controller; Fixed point vs. Floating point representation, Implementation of PID controller; Implementation of digital filters, Quantization, Overflow and resource issues; Case

studies: Digital power supply design and motor control		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**30 hours**

Mode of Evaluation: CAT, Laboratory Assessment/Assignment / Quiz / FAT			
Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA506P	Real Time Embedded Systems Lab	0	0	2	1
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Acquire programming and hardware skills in typical embedded system development cycle
2. Demonstrate the different embedded system design concepts using cortex-M microcontroller

Course Outcomes

On completion of this course, the students will be able to:

1. Use modern software and hardware development tools for embedded system design
2. Develop embedded system to solve real world control and automation problems

Indicative Experiments

1.	Implementation of simple C programming concepts in IDE: Bitwise operations, control blocks and functions
2.	GPIO Programming: Interfacing input and output devices
3.	Study of polling and interrupts using a Cortex-M microcontroller
4.	Generation of PWM signals for the given frequency and duty cycle using timers
6.	Implementation of analog interfacing using ADC Programming with potentiometer
6.	Measurement of voltage and current for data acquisition system design
7.	Measurement of process variables: Temperature, level, position and speed
8.	Interfacing I2C based 3-axis accelerometer sensor
9.	Implementation of CAN network and analysis using logic analyzer
10.	Implementation of digital FIR filter and FFT in Cortex-M microcontrollers
11.	Design and implementation of real-time PID control system for speed or position control of motor
12.	Pre-emptive task scheduling using RTOS kernel for multitasking applications

Total Laboratory Hours **30 hours**

Mode of assessment: Continuous assessment, FAT

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA507L	Industrial Automation	2	0	0	2
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. Deliver a strong foundation to solve batch process and continuous process control
2. Technical competence through hands-on experience with industrial automation tools like PLC, DCS, and SCADA.
3. Exposure to various communication protocols used in industrial automation

Course Outcomes:

On the completion of this course the student will be able to:

1. Outline the basic concepts of computer-based automation, data communication and Industry 4.0.
2. Identify the main parts of PLC and describe their functions.
3. Develop a PLC ladder logic and Function block diagram to automate the process.
4. Elaborate the requirements of PLC enclosure, noise reduction techniques, proper grounding practices, and troubleshooting procedures.
5. Identify the hardware and software components of HMI, SCADA and Distributed Control System and configure a DCS programming.

Module:1	Role of Computers in Automation:	4 hours

Data loggers ; Data Acquisition Systems (DAS) ; Functional block diagram of computer based control system ; Sampling considerations ; Automation: Definition, Benefits, Examples, Evolution of Automation ; Automation Components: Discrete Switches, Analog Sensors, Relays, Actuators, and Automation tools.

Module:2	Programmable Logic Controller (PLC) : Architecture and basic Ladder Instructions	4 hours

Definition ; PLC Architecture: input/output modules, power supplies, and isolators, programming device ; Program Scan ; IEC61131-3 Standard programming languages and their selection ; PLC Basic Instructions ; Input and Output Addressing ; Ladder Diagram for Boolean Gates ; Concept of Latching and Unlatching ; Programming Timers and Counters ; Applications

Module:3	Advanced PLC Instructions and Functions	4 hours

Arithmetic functions ; Comparison functions ; Program control Instructions ; Data transfer Instructions ; Sequencer functions ; Shift register functions ; Analog PLC operation ; PLC-PID functions ; Applications ; Networking of PLC ; Design of interlocks and Alarm annunciator sequence (ISA 18.1 Standard)

Module:4	PLC Installation and Troubleshooting	4 hours

PLC Enclosure; Electrical Noise; Leaky inputs and outputs; Grounding; Voltage Variations and surges; preventive maintenance; Troubleshooting: Processor Module, I/O Malfunctions, PLC program.

Module:5	Supervisory Control and Data Acquisition (SCADA)	4 hours

SCADA Components: Human Machine Interface, Supervisory System, Remote Terminal Unit, Controller, Intelligent Electronic Devices ; Types of SCADA Architectures ; SCADA Communication : IEC61850, Modbus, Distributed Network Protocol (DNP), OPC UA

IEC62541 Standard		
Module:6	**Distributed Control System (DCS)**	**4 hours**
Evolution of Distributed Control Systems ; Generalized architecture of DCS: Local Control unit – Data Input and Output Unit, Operator Interface , Engineering interface ; DCS commissioning and Configuration ; Programming a DCS ; Redundancy concept ; Selection of DCS ; Case Studies: Thermal power plant , Water treatment plant		
Module:7	**Advances in Industrial Automation**	**4 hours**
Data communication: HART Protocol ; Field bus Protocol; Industrial Ethernet ; Wireless MAC Standards– IEEE 802.11- IEEE 802.15.4 , Wireless HART ; ISA 100 Wireless Standard for Automation ; 4th Industrial revolution Industry 4.0 ; Building blocks of Industrial IoT.		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**30 hours**

Text Book(s)

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA507P	Industrial Automation Lab	0	0	2	1
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Identify the hardware and software requirements of process and factory automation.
2. Configure and construct both PLC and DCS programs to implement process and factory automation.

Course Outcomes

On completion of this course, the students will be able to:

1. Develop a ladder program for a given automation application using Timer, counter, and Advanced Function block instructions.
2. Configure DCS and create a Function block diagram for the closed-loop process control and Monitoring application.

Indicative Experiments

1.	Create a Ladder program to automate the continuous filling system using basic instructions in PLC.
2	Create a Ladder program to implement Alarm annunciator sequence (ISA 18.1 Standard) using Timer Instructions
3.	Create a Ladder program to design an Automatic Parking System using Counter instructions in PLC
4.	Construct a Ladder/Function Block program to design an Automatic weighing system
5.	Program a ladder/Function Block program to control traffic in four-way Sequencer Output Instruction in PLC
6.	Interface the Analog /Digital Input /Output devices with Industrial type Standalone PLC.(Temperature Sensor /Limit Switch/ Photo Sensor/ Hooter/Light Indicator/Relay)
7.	HMI Configuration and Programming of Discrete Control Sequence Process
8.	DCS commissioning and hardware configuration (AI, AO, DI and DO Modules).
9.	Construct a DCS functional block programming to design an Interlock system
10.	Interfacing Filed devices with DCS and build PID configuration in DCS
11.	SCADA configuration and programming of Level /Temperature process control and Monitoring
12.	Realization of various closed loop control schemes of Pilot plant (Level/Flow/Temperature/Pressure Process) using DCS
13.	IoT Based Level/Temperature Monitoring System
	Total Laboratory Hours **30 hours**

Mode of assessment: Continuous assessment, FAT

Recommended by Board of Studies		09-07-2022		
Approved by Academic Council		No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA601L	Building Automation	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. To impart knowledge on various systems involved in a building management system.
2. To give exposure on factors influencing controller design for building automation

Course Outcome:

On the completion of this course the student will be able to:

1. Demonstrate the importance of building automation and design fire alarm system for building automation
2. Construct the access control system with enhanced security and examine the various components of HVAC
3. Design, implement and evaluate the performance of controllers for BAS to meet various factors.
4. Develop and enhance the efficiency of energy management system.
5. Formulate a building management system for a given problem.

Module:1	Introduction:	4 hours

Concept and application of Building Management System (BMS) and Automation: requirements and design considerations and its effect on functional efficiency of building automation system, architecture and components of BMS

Module:2	Fire Alarm System:	6 hours

Fundamentals: Fire modes, History, Components, and Principles of Operation. FAS Components: Different fire sensors, smoke detectors and their types, Fire control panels, design considerations for the FA system. Field Components, Panel Components, Applications. FAS Architectures: Types of Architectures, Examples. FAS loops: Classification of loops, Examples. Fire Standards: FAS Design procedure in brief, NFPA 72A, BS 5839, IS Concept of IP enabled fire & alarm system, design aspects and components of PA system.

Module:3	Access Control System:	8 hours

CCTV: Camera: Operation & types, Camera Selection Criteria, Camera Applications, DVR Based system, DVM, Network design, Storage design. Components of CCTV system like cameras, types of lenses, typical types of cables, controlling system.
Security Design: Security system design for verticals. Concept of automation in access control system for safety, Physical security system with components, RFID enabled access control with components, Computer system access control – DAC, MAC, RBAC.

Module:4	HVAC system:	8 hours

Fundamentals: Introduction to HVAC, HVAC Fundamentals, Basic Processes (Heating, Cooling etc)
Basic Science: Air Properties, Psychometric Chart, Heat Transfer mechanisms, Examples.
Human Comfort: Human comfort zones, Effect of Heat, Humidity, Heat loss.
Processes: Heating Process & Applications (i.e., Boiler, Heater), Cooling Process & Applications (i.e., Chiller), Ventilation Process & Applications (i.e., Central Fan System, AHU, Exhaust Fans), Unitary Systems (VAV, FCU etc).

Module:5	Field Control System and Networking Protocols:	5 hours

Instrumentation Basics, Field components & use, DDC, DCS & applications. Control Panel: HVAC Control Panel, MCC Basics, Panel Components Communication: Communication Basics, Networks, BACNet, Modbus, LON		
Module:6	**Energy Management System:**	**6 hours**
ASHRAE Symbols -Energy Management: Energy Savings concept & methods, lighting control, Building Efficiency improvement, Green Building, Concept & Examples.		
Module:7	**Building Management System:**	**6 hours**
BMS (HVAC, Fire & Security) project cycle, Project steps BMS. Verticals: Advantages & Applications of BMS, Examples Integration: IBMS. Architecture, Normal & Emergency operation. Advantages of BMS		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Mode of Evaluation**:** CAT / Assignment / Quiz / FAT			
Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA602L	Industrial Robotics	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. To understand the importance of robotics in scientific and industrial domains.
2. To introduce mathematical aspects of robotics such as spatial transformations. Kinematics and dynamics of the manipulator.
3. To develop a controller for tracking a desire trajectory and path planning by a robot.

Course Outcome

At the end of the course, the students will be able to

1. Understand the concept of forward and inverse kinematic of robot manipulators.
2. Develop the dynamics of the robotic manipulator using Euler Lagrangian approach.
3. Demonstrate an ability to generate joint trajectories for motion planning.
4. Implement the PD and PID controller for independent joint control.
5. Formulate solutions to solve problems related to robotics.

Module:1	**Introduction to Robotics**	**5 hours**
Basic definitions- Fundamentals about robot technology-Degree of freedom- Serials parallel manipulator, work space, classification of robots- Industrial Robots-actuator and gripper.		
Module:2	**Kinematics**	**8 hours**
Position and orientation of links-Coordinate transformation-d-h parameters-Joint variable and position of end effectors-Inverse kinematic analysis.		
Module:3	**Velocity and static force analysis**	**9 hours**
Translational and rotational velocities-Velocity transformations –Jacobian- Inverse kinematics of velocity-Static force/torque transformations-Recursive equations of motion and static force/torque relationships.		
Module:4	**Trajectory generation**	**5 hours**
Point -to-point vs Continuous motion- Cubic and Quintic Polynomials- Linear functions with parabolic blends-Via points-Cartesian paths- Kinematic control.		
Module:5	**Manipulator Dynamics**	**9 hours**
Newton Euler formulation of robot dynamics- Actuator dynamics- Computational considerations.		
Module:6	**Robot Positional Control**	**5 hours**
Independent joint control-Feed forward control based on PD and PID compensators-Computed Torque control-Linear and Nonlinear controller design of robot.		
Module:7	**Application of Robotics**	**2 hours**
Applications of robotics in active perception, medical robotics- autonomous vehicle and other acres.		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Course Code	Course Title	L	T	P	C
MCOA603L	Control of Electric Drives	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. To provide the concepts and basic operation of electric drive system
2. To Analyse the solid state control of dc, induction and synchronous machine drives
3. To provide the design techniques of drive system

Course Outcome:

On the completion of this course the student will be able to:

1. Identify the need of various, electrical machines, power converters and control systems.
2. Design the phase controlled and chopper controlled DC motor drives.
3. Develop the dynamic model and control of IM Drives.
4. Analyse the performance of permanent magnet machines Drives.
5. Apply intelligent control algorithms/ techniques for control of electric drives.

Module:1	Introduction to Electric Drives	6 hours

Review of electric drive system, electrical machines, power converters and control, Different types of loads encountered in drive applications, Dynamics of drive systems, starting, braking, and speed-control.

Module:2	Phase Controlled DC motor drives:	5 hours

Single quadrant, Two –quadrant and four quadrant rectifier fed dc separately excited d.c. motor - Closed loop operation of rectifier fed drive, design of controller

Module:3	Chopper Controlled DC motor drives:	5 hours

Single quadrant, Two –quadrant and four quadrant chopper fed dc separately excited motor – Closed loop operation of chopper fed drive, design of controller

Module:4	Dynamic Modelling of Induction Machines	8 hours

Model of a Two phase induction machine, Three phase to two phase transformation- Power Equivalence Generalised Model in Arbitrary reference Frames, Electromagnetic Torque , stator Reference Frames Model , Rotor Reference Frames Model , Synchronously rotating Reference Frames Model

Module:5	Control of Induction Motor Drive:	8 hours

Stator- Voltage Control, Slip· Energy Recovery Scheme , Voltage-Source Induction Motor Drives , Current Source Induction Motor Drives , V/f control, need for vector control, direct and indirect vector control of induction motor drives.

Module:6	Permanent-Magnet Synchronous and Brushless DC Motor Drives	5 hours

Permanent Magnets and Characteristics, Permanent synchronous motor drive, Sensor less control of Permanent synchronous motor drive, Permanent Magnet Brushless DC motor, Sensor less control of PMBLDCM Drive.

Module:7	Intelligent Control of Electric Drives:	6 hours

Fuzzy Logic Control of ac and dc Drives, Artificial Neural Network control of ac and dc

Drives, Hybrid Fuzzy/PI Control of ac and dc Drives,		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 Hours**

Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA604L	Machine Learning	2	0	0	2
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. To provide the student with a broad understanding of machine learning algorithms and their applications.
2. To Understand and Interpret machine learning concepts, such as to robotic control, data mining, autonomous navigation, bioinformatics, speech recognition, and text and web data processing to the real world applications.

Course Outcome:

At the end of the course, the student will be able to:

1. Apply gradient descent approach for regression problems and Instant based learning for Classification problems.
2. Analyze and interpret the data using multiple classes and text classification problems.
3. Analyze the data using SVM, LDA and PCA
4. Apply Reinforcement learning by formulating MDP and computing optimal policy for continuous variables or higher dimension.
5. Conduct experiments to design a component or a product applying all the relevant standards with realistic constraints.

Module:1	Introduction, Regression Problem and Gradient Descent	4 hours

Introduction: Prediction, Classification, Forecasting, Filtering, Regression, Clustering. Review of Linear Algebra, Probability and Statistics. Data Exploration and Pre-processing: Data Objects and Attributes; Statistical Measures, Visualization, Data Cleaning and Integration, Linear Regression; Gradient Descent, Batch Gradient Descent, Stochastic Gradient Descent, The Concept of Under fitting and Overfitting.

Module:2	Classification Problem and Instance Based Learning	4 hours

The Concept of Parametric Algorithms and Non-parametric Algorithms: Locally Weighted Regression, The motivation of Logistic Regression, Logistic Regression and Perceptron Learning Algorithm.

Module:3	Multiple Classes and Text Classification	4 hours

Softmax Regression Discriminative Algorithms, Generative Algorithms, Gaussian Discriminant Analysis (GDA) and Naive Bayes algorithm.

Module:4	Support Vector Machine Algorithm	4 hours

Intuitions about Support Vector Machine (SVM): Notation for SVM, Functional and Geometric Margins.

Module:5	Dimensionality Reduction	4 hours

Linear Discriminant Analysis (LDA); Principal Component Analysis (PCA); Transform Domain and Statistical Feature Extraction and Reduction.

Module:6	Markov Decision Process and Reinforcement Learning	4 hours

Applications of Reinforcement Learning: Markov Decision Process (MDP); Defining Value & Policy Functions, Value Function and Optimal Value Function.

Module:7	Computing an Optimal Policy	4 hours

Value Iteration: Policy Iteration; Generalization to Continuous States; Discretization & Curse of Dimensionality and Fitted Value Iteration algorithm.

Module:8	**Contemporary Issues**			**2 hours**
	Total Lecture hours:			**30 hours**

Mode of Evaluation**:** CAT / Assignment / Quiz / FAT / Lab / Seminar				
Recommended by Board of Studies		09-07-2022		
Approved by Academic Council		No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA604P	Machine Learning Lab	0	0	2	1
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Understand the implementation procedures for the machine learning algorithms using Matlab /R/Python, Weka.
2. Understand modern notions in data analysis-oriented computing and conduct experiments to design a component or a product applying all the relevant standards with realistic constraints.

Course Outcomes

On completion of this course, the students will be able to:

1. Apply appropriate data sets to the Machine Learning algorithms.
2. Identify and apply Machine Learning algorithms to solve real world problems

Indicative Experiments

1.	Implement the non-parametric Locally Weighted Regression algorithm in order to fit data points. Select appropriate data set for your experiment and draw graphs.	
2.	Implement linear regression using python. Select appropriate data set for your experiment and plot the graphs.	
3.	Write a program to construct a Bayesian network considering medical data. Use this model to demonstrate the diagnosis of heart patients using standard Heart Disease Data Set. You can use Java/Python ML library classes.	
4.	Write a program to implement k-Nearest Neighbour algorithm to classify the iris data set. Print both correct and wrong predictions. Java/Python ML library classes can be used for this problem.	
5.	Implement k-means clustering for classification.	
6.	Implement an algorithm to demonstrate the significance of genetic algorithm	
7.	Write a program to demonstrate the working of the decision tree based ID3 algorithm. Use an appropriate data set for building the decision tree and apply this knowledge to classify a new sample.	
8.	Implement PCA, LDA for dimensionality reduction using MATLAB. Use this model to demonstrate the diagnosis of Epilepsy patients using standard EEG Data Set.	
9.	Implement SVM tool for the detection of the Epilepsy patients using standard EEG Data Set. Also use standard Heart Disease Data Set to detect the heart disease.	
10.	Implementation of popular architectures related to CNN, RNN, LSTM and Auto-encoder	
11.	Implementation of Time Series Clustering and alignment algorithms	
12.	Implementation of Reinforcement Learning algorithms.	
	Total Laboratory Hours	**30 hours**

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA605L	Advanced Python programming	1	0	0	1
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. Design and apply programming constructs in Python to solve engineering problems.
2. Apply embedded programming features in Python

Course Outcomes:

1. Acquire programming skills in python
2. Perform coding using loops and conditional execution.
3. Ability to create and use different data structures.
4. Create functions, modules and packages to facilitate reusability of the code.
5. Developing python constructs for control engineering applications

Module:1	Fundamentals of Python Programming	2 hours
History of python- Python shell- Programming using IDE- Indentation-Comments, Variables-Data types- conversion- Operators-Different forms of Assignment-Reserved words- Built in functions		
Module:2	**Flow controls**	**2 hours**
Conditional blocks using If, else, elif-For loop-For loop using in range-while loop- Loop manipulation using pass, break ,continue and else.		
Module:3	**Data structures**	**2 hours**
Lists-Tuples-Sets-Dictionaries-Various operations on data structures-user defined data structures		
Module:4	**Functions and Files**	**2 hours**
Defining a function-calling a function- local and global scope of variables-lambda function-Files-create, read, write, append, close		
Module:5	**String handling**	**2 hours**
Strings -various operations on strings- Regular expressions-Matching, replace, patterns		
Module:6	**Modules and packages**	**2 hours**
Creating module-Importing module-in built modules-user defined modules-Overview of numpy, matplotlib, control packages		
Module:7	**Control Engineering using Python**	**3 hours**
Time response analysis-Stability analysis-Root locus-Bode plot-PID controller-State space analysis-state feedback, observer design		
Mode of evaluation: No separate evaluation for theory		
	Total Lecture hours:	**15 hours**

Course Code	Course Title	L	T	P	C
MCOA605P	Advanced Python Programming Lab	0	0	4	2
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Apply embedded programming features in Python to solve engineering problems.

Course Outcomes

On completion of this course, the students will be able to:

1. Acquire programming skills in python
2. Design and analysis of control theory applications using python

Indicative Experiments

1.	Write a program to perform various athematic operation on two numbers
2	Write a program to find simple and compound interest
3.	Write a program to find the prime numbers in a given range
4.	Write a program to calculate distance between two cartesian coordinates by taking inputs from user
5.	Write a program to find whether the given number is even or odd
6.	Write a program to generate Fibonacci series
7.	Write a program to count number of characters/words in a file
8.	Write a program to find the factorial of a number
9.	Write a function two find roots of a quadratic equation
10	Create a function to compute gcd and lcm
11	Write a program to detect and remove repetitive words in a list
12	Write a program to find union and intersection of two lists
13	Write a program to separate positive and negative numbers from a list
14	Write a program to map lists into a dictionary
15	Write a program to capitalize a specific word in a list/file
16	Write a program to find a value in list using linear search/binary search
17	Write a program to sort a list using selection sort/insertion sort/merge sort
18	Write a program to check whether the given string is palindrome
19	Write a program to detect substrings in a given strings
20	Time response analysis of first order systems
21	Stability analysis using root locus
22	Stability analysis using bode plot
23	Design full state feedback controller
	Total Laboratory Hours **60 hours**

Mode of assessment: Continuous assessment, FAT

Mode of Evaluation: Assignment, FAT

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA606L	Optimal Control Systems	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

The course is designed to enable the students to

1. Understand the optimal control theory fundamentals and apply the dynamic programming method for finding the optimal control law
2. Use the variational approach for solving the constrained optimal problem and
3. Compare the different iterative methods used for solving the optimal control problems

Course Outcome

At the end of the course, the student will be able to

1. Formulate the optimal control problem and find an optimal solution for the functionals with boundary conditions.
2. Determine an optimal control law using dynamic programming technique for a practical dynamic system.
3. Solve the optimal control problems using variational approach and determine a control law for optimal tracking and regulatory problems.
4. Design a controller for achieving the desired output in minimum time and with optimal control effort.
5. Determine an optimal control using different numerical techniques with MATLAB tool.

Module:1	Introduction	6 hours

Optimal Problem formulation: Mathematical model, Physical constraints, Performance measure – Form of optimal control – Performance measures for optimal control problem – Selecting a performance measure.

Module:2	Calculus of Variations	8 hours

Basic concepts: Function and functionals, Increment, Differential and variation – Functionals of a single function – Functionals involving several independent functions – Piecewise–smooth extremals – Constrained extrema: Direct method, Lagrange multiplier method.

Module:3	Dynamic Programming	7 hours

Optimal control law – Principle of optimality – Dynamic programming: Computational procedure, Interpolation – Recurrence relation of dynamic programming –- Characteristics of dynamic programming solution.

Module:4	Variational Approach	5 hours

Hamilton–Jacobi–Bellman equation – Continuous linear regulator problems – Variational approach to optimal control problems: Necessary conditions for optimal control.

Module:5	Linear Quadratic Optimal Control Systems	6 hours

Finite time linear regulator problems – Finite time Linear tracking problems – Solution of general continuous time optimal control problem – Continuous time Linear Quadratic Regulator design – Riccati equation – Pontryagin's minimum principle – state inequality constraints.

Module:6	Constrained Optimal Control Systems	5 hours

Time optimal control of LTI system – Fuel optimal control systems – Energy optimal control systems – Singular intervals in optimal control problems.

Module:7	Iterative Numerical Techniques	6 hours

Two point boundary–value problems – Method of steepest decent – variation of extremals – Quasilinearization – Gradient projection algorithm – Case studies.

Module:8	Contemporary Topics	2 hours

	Total Lecture hours:	**45 hours**

Mode of Evaluation **:** Continuous Assessment Tests, Quizzes, Assignment, Final Assessment Test			
Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA607L	Adaptive and Robust Control	3	0	0	3
Pre-requisite	MCOA502L, MCOA502P	Syllabus version			
		1.0			

Course Objectives:

1. Expose to techniques of system identifications for time varying systems
2. Design of Adaptive Control Systems
3. Analyze uncertain systems and design robust control systems.

Course Outcome:

On the completion of this course the student will be able to:

1. Estimate system parameters and design self-tuning regulators
2. Apply Lyapunov theory and MIT rule to design Model-Reference Adaptive Control schemes
3. Utilize vector fields to analyze variable structured systems and design sliding mode control law
4. Analyze the stability of systems with unstructured uncertainty and design robust control loops satisfying system norms
5. Utilize simulation tools to design, implement and test adaptive and robust control strategies

Module:1	Adaptive Control Approach	6 hours

Background: Linear feedback, Effects of process variations, Adaptive control schemes; Estimation: Parameter estimation, Least squares and Regression models; Estimating Parameters in Dynamical Systems; Recursive least squares (RLS) estimate

Module:2	Self-Tuning Regulators (STR)	6 hours

Controller design: Minimum degree pole placement (MDPP) design; Direct and Indirect self-tuning regulators; Continuous-time self-tuners; Stochastic self-tuning regulators; Minimum variance controller design, Minimum average controller design; Linear Quadratic STR, Adaptive Predictive Control

Module:3	Model-Reference Adaptive Control (MRAC)	6 hours

Series and Parallel MRAC schemes; The MIT Rule, Determination of adaptation gain; Lyapunov Theory: Design of MRAC Using Lyapunov Theory; Bounded-Input Bounded- Output Stability; Applications to Adaptive Control, MRAC via Output Feedback; Relations between MRAS and STR.

Module:4	Gain Scheduling Control	7 hours

Principle; Design approach: Linearization of nonlinear actuators, Measurement of auxiliary variable, Time scaling based on production rate, Nonlinear transformation of the system dynamics; Application of gain scheduling controllers; Case studies: Industrial adaptive controllers, ship steering

Module:5	Sliding Mode Control	6 hours

Variable structure systems, Vector field; Sliding surfaces; Continuous approximations of switching control laws; Modeling and Performance Trade-Offs; Relay control for multi-input systems

Module:6	Model Uncertainty	6 hours

Unstructured uncertainty and system model; Stability under unstructured uncertainties; Robust stability criteria; Robust performance analysis: Small gain theorem, μ- Analysis and Synthesis, Lyapunov approach

Module:7	**H_2 and H_∞ Control**	**6 hours**
Norms: Computation of H_2 and H_∞ norms; Standard LQR, LQG control problem; Robust Control Problem as H_2 and H_∞ Control; H_2 and H_∞ control synthesis; LQG as special H_2 controller; Case study on aircraft hovering		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Recommended by Board of Studies	09-07-2022		
Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA608L	Discrete Control Systems	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. To impart the in-depth knowledge of control theory, design of different controllers, analysis of discrete systems by state space analysis.
2. To analyze the concepts of realizing discrete systems.

Course Outcomes:

On the completion of this course the student will be able to:

1. Analyze discrete-time systems by using the z-transform.
2. Propose the model and analyze the response and stability of systems in discrete domain.
3. Design and realize digital controllers.
4. Design and analysis of discrete systems using state space approach
5. Analyze the Practical implementation of discrete systems and associated constraints

Module:1	Introduction to Discrete Control System:	6 hours

Introduction- continuous versus digital control- sampling process- effect of sampling rate-Discrete time system representation-Z-transform-Mapping of s-plane to z-plane.

Module:2	Discrete Time System Modelling and Response:	6 hours

Pulse transfer function-Signal flow graph-Stability analysis-Jury Stability-Bilinear transformation-Time Response-Transient and steady state response of second order system

Module:3	Design of Digital Controller:	8 hours

Discretization of continuous transfer functions-Controller design using transformation techniques-Z- plane specifications-Design in the w domain- Digital PID controller-dead-beat controller-Dahlin's controller- Root Locus design.

Module:4	Discrete state space model:	7 hours

Introduction to state space-state equation-solutions-conversion of state space to transfer function-state space modeling-solution to discrete state equation.

Module:5	Design via State space:	8 hours

Controllability-Observability- stability-Pole placement by state feedback-Full order observer design- Reduced order observer design.

Module:6	Quantization effects:	4 hours

Quantization effects-Truncation and Rounding off error – SNR- Limit cycles and dither-Sample rate reduction.

Module:7	Realization of discrete controllers	4 hours

Mechanization of control algorithms- Iterative computation via parallel, direct, canonical, cascade realization- Effects of computing time- Systems with time delay-Case studies.

Module:8	Contemporary Issues	2 hours
	Total Lecture hours:	45 hours

Approved by Academic Council	No. 67	Date	08-08-2022

Course Code	Course Title	L	T	P	C
MCOA609L	Multivariable Control System	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. To describe the fundamentals of multivariable control design.
2. To demonstrate the performance of state feedback and output feedback control techniques
3. To analyze the effects of decentralized control and decoupling schemes.

Course Outcome

At the end of the course, the student will be able to

1. Develop mathematical models of a multivariable process
2. Analyze multivariable systems and multi-loop control schemes
3. Apply decentralized control to MIMO systems
4. Analyze MIMO systems using state space analysis
5. Design controllers for MIMO systems using optimization techniques

Module:1	**Introduction to Multivariable Control:**	**6 hours**

Multivariable systems – Transfer function for MIMO systems – Fundamental limitations on sensitivity – Limitations imposed by time delays, RHP-zeros and input constraints

Module:2	**Linear System Analysis:**	**7 hours**

Linear system time response – stability conditions – gain – frequency response - system internal structure – Block system structure - model reduction – Solutions to the control problem: variable selection – control structures – two degree of freedom controller - hierarchical control.

Module:3	**Decentralized Control:**	**6 hours**

Introduction – Plant decomposition, grouping of variables – Multi-loop control and paring selection: relative gain array(RGA) , integrity, diagonal dominance – RGA properties and application.

Module:4	**Decoupled Control:**	**6 hours**

Decoupling schemes: Feedforward, feedback, SVD - Enhancing SISO loops with MIMO techniques: cascade control- Sequential-Hierarchical design and tuning.

Module:5	**Centralised Closed-loop Control:**	**6 hours**

State feedback – output feedback – rejection of deterministic unmeasurable disturbances – case study.

Module:6	**Optimisation based control:**	**6 hours**

Optimal state feedback – optimal output feedback – predictive control – Generalised optimal disturbance rejection problem – case study.

Module:7	**Designing for Robustness and implementation:**	**6 hours**

Uncertainty and feedback – trade-offs and design guidelines – robustness analysis methodologies – controller synthesis – control implementation – implementation technologies - Control Schemes for Distillation Column, CSTR and Four-tank system

Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Approved by Academic Council	No. 67	Date	08-08-2022	

Course Code	Course Title	L	T	P	C
MCOA610L	Industrial Data Networks	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. To describe the different network topologies and protocols
2. To identify the requirements of data communications including encoding, synchronization and protocols.
3. To analyze the features and operations of Modbus, HART and ProfiBus.

Course Outcome

At the end of this course, the student will be able to:

1. Describe the rudiments of how industrial devices communicate.
2. Infer the standards in network design and ensure the best practice followed in installing and commissioning data networks
3. Analyze Industrial Ethernet protocol for interfacing higher layer devices in automation pyramid.
4. Explain master-slave functioning of Modbus and implement for networking devices like smart meters.
5. Interpret HART handheld controller for calibration of field devices and interface field level devices using Fieldbus protocol.

Module:1	**Introduction to Networks:**	**6 hours**
Network topology -Classification of networks: LANs, MANs, WANs, GANs- OSI Model- Foundations of OSI Model. Protocol – Standards.		
Module:2	**Physical Interface Standards:**	**5 hours**
EIA 232 overview, EIA 485 overview, EIA 484 Installation, noise problems, current loop & EIA converters		
Module:3	**Industrial Ethernet:**	**7 hours**
Introduction-IEEE Standards-Ethernet MAC layer-IEEE 802.2 and Ethernet SNAP- OSI and IEEE 802.3 standard. Ethernet transceivers, Ethernet types, switches & switching hubs, 10 Mbps Ethernet, 100 Mbps Ethernet, Gigabit Ethernet. TCP / IP Overview- Internet Layer Protocols- Host-to-Host layer		
Module:4	**Modbus:**	**7 hours**
Overview-Protocol Structure-Example Function codes. Modbus Plus protocol- Overview, Networking Modbus plus. Data Highway Plus/DH485 Overview, AS – interface Overview- Layers- Operating Characteristics.		
Module:5	**HART Overview:**	**5 hours**
Introduction to HART and smart instrumentation, HART Protocol, Physical layer, Data link layer, and application layer, Application in SCADA		
Module:6	**ProfiBus overview:**	**6 hours**
Introduction, ProfiBus protocol stack, ProfiBus communication model, communication objects, performance, system operation, ProfiBus in Automation		
Module:7	**Foundation Fieldbus overview:**	**7 hours**
Introduction to Foundation Fieldbus- Architecture- physical layer and wiring rules, data link layer, application layer and user layer.		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Course Code	Course Title	L	T	P	C
MCOA611L	Data Acquisition and Hardware Interfaces	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. To impart an in-depth knowledge in data acquisition, and analysis.
2. To provide a comprehensive coverage of data acquisition methods and hardware interface cards available commercially
3. To provides knowledge of different data acquisition systems used in industry.

Course Outcome:

On the completion of this course the student will be able to:

1. Interpret the elements of data acquisition techniques.
2. Comprehend the function of signal conditioning for various sensor and grounding for data acquisition system
3. Design and simulate Virtual Instrumentation using Lab view and different NI DAQ card
4. Comprehend the functioning of different communication interface for data acquisition system
5. Design Hardware in loop using Lab view and MATLAB DSPACE

Module:1	Fundamentals of Data acquisition:	6 hours

Generalized instrumentation system, PC-Based instrumentation system, Principles of data acquisition, Generalized data acquisition system, S/H circuits, and Multi-channel data acquisition systems.

Module:2	Signal conditioners for Data acquisition:	6 hours

Signal conditioners- voltage conditioners-integrated signal conditioners for temperature sensors, strain gages, piezoelectric sensors and linear position sensors. Signal conditioning modules for plug-in board, two-wire transmitter, and high speed digital transmitter. Field wiring and signal measurement-grounded and floated signal source-single ended and differential ended measurements. Ground loop and system isolation-noise and interference-shielding.

Module:3	Basic Virtual Instrumentation:	7 hours

LabVIEW - Graphical user interfaces - Controls and Indicators - 'G' programming - Data type, Format, Precision and representation - Data flow programming - Debugging and Running Virtual instrument - Functions and Libraries. FOR loops, WHILE loops, CASE structure, formula nodes –Math script -Sequence structures, , Real-Time System, VISA Field Point I/O, Compact RIO I/O and Intelligent Real-Time Embedded Controller. PCI or PXI R Series device,

Module:4	Common interface standards for data acquisition systems:	6 hours

RS232C, RS485, GPIB standard IEEE488.2, Distributed and standalone data loggers-storage and retrieval- USB, HART Protocol, Foundation Fieldbus, Device net, Profibus, Control net, and Industrial , Ethernet , Sigsbee , Bluetooth & Internal Calibration

Module:5	NI DAQ cards for Data acquisition systems :	6 hours

Data acquisition systems using USB DAQ card, MiRIO , PCI or PXI R Series device, CDAQ, MyRIO , CRIO, NI ELVIS.

Module:6	Real Time Hardware interface implementation using	6 hours

	Lab VIEW and NI DAQ Card:	
Real Time Hardware Interface using LabVIEW. Hardware in the loop (HIL) for temperature measurement, DC motor speed control, Induction motor control, MPPT based solar PV based system , Electric vehicle. System, Robotics control		
Module:7	**Real Time Hardware interface implementation using MATLAB/SIMULINK and DSPACE DAQ CARD:**	**6 hours**
Real Time Hardware Interface using MATLAB /SIMULINK, Hardware in the loop (HIL) for temperature measurement, DC motor speed control, Induction motor control, MPPT based solar PV based system , Electric vehicle. System, Robotics control		
Module:8	**Contemporary Issues**	**2 hours**
	Total Lecture hours:	**45 hours**

Course Code	Course Title	L	T	P	C
MCOA696J	Study Oriented Project				02
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. The student will be able to analyse and interpret published literature for information pertaining to niche areas.
2. Scrutinize technical literature and arrive at conclusions.
3. Use insight and creativity for a better understanding of the domain of interest.

Course Outcome:

1. Retrieve, analyse, and interpret published literature/books providing information related to niche areas/focused domains.
2. Examine technical literature, resolve ambiguity, and develop conclusions.
3. Synthesize knowledge and use insight and creativity to better understand the domain of interest.
4. Publish the findings in the peer reviewed journals / National / International Conferences.

Module Content	(Project duration: One semester)

This is oriented towards reading published literature or books related to niche areas or focussed domains under the guidance of a faculty.

Mode of Evaluation: Evaluation involves periodic reviews by the faculty with whom the student has registered. Assessment on the project – Report to be submitted, presentation and project reviews – Presentation in the National / International Conference on Science, Engineering Technology.

Recommended by Board of Studies	09-07-2022

Course Code	Course Title	L	T	P	C
MCOA697J	Design Project				02
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

1. Students will be able to design a prototype or process or experiments.
2. Describe and demonstrate the techniques and skills necessary for the project.
3. Acquire knowledge and better understanding of design systems.

Course Outcome:

1. Develop new skills and demonstrate the ability to upgrade a prototype to a design prototype or working model or process or experiments.
2. Utilize the techniques, skills, and modern tools necessary for the project.
3. Synthesize knowledge and use insight and creativity to better understand and improve design systems.
4. Publish the findings in the peer reviewed journals / National / International Conferences.

Module Content **(Project duration: One semester)**

Students are expected to develop new skills and demonstrate the ability to develop prototypes to design prototype or working models related to an engineering product or a process.

Mode of Evaluation: Evaluation involves periodic reviews by the faculty with whom the student has registered. Assessment on the project – Report to be submitted, presentation and project reviews – Presentation in the National / International Conference on Science, Engineering Technology.

Course Code	Course Title	L	T	P	C
MCOA698J	Internship I/ Dissertation I				10
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives:

To provide sufficient hands-on learning experience related to the design, development and analysis of suitable product / process so as to enhance the technical skill sets in the chosen field and also to give research orientation.

Course Outcome:

1. Considerably more in-depth knowledge of the major subject/field of study, including deeper insight into current research and development work.
2. The capability to use a holistic view to critically, independently and creatively identify, formulate and deal with complex issues.
3. A consciousness of the ethical aspects of research and development work.
4. Publications in the peer reviewed journals / International Conferences will be an added advantage.

Module Content	(Project duration: one semester)

1. Dissertation may be a theoretical analysis, modeling & simulation, experimentation & analysis, prototype design, fabrication of new equipment, correlation and analysis of data, software development, applied research and any other related activities.
2. Dissertation should be individual work.
3. Carried out inside or outside the university, in any relevant industry or research institution.
4. Publications in the peer reviewed journals / International Conferences will be an added advantage.

Mode of Evaluation: Assessment on the project - Dissertation report to be submitted, presentation, project reviews and Final Oral Viva Examination.

		1.0			

Course Objectives:

To provide sufficient hands-on learning experience related to the design, development and analysis of suitable product / process so as to enhance the technical skill sets in the chosen field.

Course Outcome:

Upon successful completion of this course students will be able to

1. Formulate specific problem statements for ill-defined real life problems with reasonable assumptions and constraints.
2. Perform literature search and / or patent search in the area of interest.
3. Conduct experiments / Design and Analysis / solution iterations and document the results.
4. Perform error analysis / benchmarking / costing.
5. Synthesize the results and arrive at scientific conclusions / products / solution.
6. Document the results in the form of technical report / presentation.

Module Content **(Project duration: one semester)**

1. Dissertation may be a theoretical analysis, modeling & simulation, experimentation & analysis, prototype design, fabrication of new equipment, correlation and analysis of data, software development, applied research and any other related activities.
2. Dissertation should be individual work.
3. Carried out inside or outside the university, in any relevant industry or research institution.
4. Publications in the peer reviewed journals / International Conferences will be an added advantage.

Course code	Course Title	L	T	P	C
MGER501L	Deutsch für Anfänger	3	0	0	3
Pre-requisite	NIL	Syllabus version			
		1.0			

Course Objectives

1. Demonstrate competency in reading, writing and speaking in Basic German.
2. Achieve proficiency in German culture oriented view point.
3. Develop basic vocabulary in the technical field.

Course Outcome

At the end of the course, the student will be able to

1. Communicate in German language in their daily life communicative situations.
2. Apply the German language skill in writing corresponding letters, E-Mailsetc.
3. Create the talent of translating passages from English-German and vice versa and to
   frame simple **dialogues** based on given situations.
4. Understand and demonstrate the comprehension of some particular new range of unseen
   written materials.
5. Develop a general understanding of German culture and society.

Module:1	Die erste Begegnung	6 hours

Einleitung, Begrüssungs formen, Länder und Sprachen, Alphabet, Buchstabieren, Personalpronomen, Zahlen (1-100), Telefonnummer und E-Mail Addressenennen W-fragen, Aussagesätze, Nomen – Singular und Plural und Artikel

Lernziel:

Verständnisvon Deutsch, Genus- Artikelwörter

Module:2	Hobbys und Berufe	6 hours

Über Hobbyssprechen, Wochentage, Jahreszeiten, und Monatenennen, Uhrzeitensagen, über Arbeit, Berufe und Arbeitszeitensprechen, Zahlen (Hundertbiseine Million) Aritel (bestimmter, unbestimmter), Plural der Substantive, Konjugation der Verben (regelmässig /unregelmässig), Ja-/Nein- Frage, Imperativmit Sie.

Lernziel :

Sätzeschreiben, überHobbyserzählen, über Berufesprechenusw.

Module:3	Alltag und Familie	7 hours

Über die Familiesprechen, eineWohnungbeschreiben, Tagesablaufschreiben, Mahlzeiten, Lebensmittel, Getränke Possessivpronomen, Negation, Kasus- Akkusatitv und Dativ (bestimmter, unbestimmterArtikel), trennnbareverben, Modalverben, Adjektive, Präpositionen

Lernziel :

Sätzemit Modalverben, Verwendung von Artikel, über Familiesprechen, eine Wohnungbeschreiben.

Module:4	Situations gespräche	6 hours

Dialoge:

a) Gespräche mit Familienmitgliedern, am Bahnhof,
b) Gespräche beim Einkaufen, in einem Supermarkt, in einer Buchhandlung
c) Gespräche in einem Hotel/ in einem Restaurant, Treffen im Cáfe, Termin beim Arzt.

Module:5	Korrespondenz	6 hours

Leseverständnis, Mindmapmachen, Korrespondenz- Briefe, Postkarten, E-Mail
